

ABSTRACT OF THE DISCLOSURE

A system, method and gaming device having a card reader and a receipt printer are provided. One processor of the gaming device communicates with a receipt printer and plays a game program. Another
5 processor operates as part of an electronic funds transfer control unit that communicates with a card reader, keypad and display for prompting the player to enter fund transfer card information. The control unit sends out fund requests over a wide area network to a remote fund repository. If the repository approves of a fund request, the approval travels back to the ticket
10 validation system, which instructs the gaming device to: (i) issue a direct transfer of funds via the credit meter, a hopper or a lottery and (ii) issue a receipt for the transfer to the player.
